

Make mezcal understandable before asking consumers to buy.

Selected work sample | Market-entry diagnosis for a premium mezcal brand in China

QUESTION

How can a premium Mexican mezcal brand convert festival visitor intent into consumer understanding and follow-up action in China?

RECOMMENDATION

Prioritize category education before brand persuasion: use familiar entry cues, clarify product value, and make the next action after interest frictionless.

Outcome snapshot

Festival performance from the China market-entry test

- 3-day offline festival activation
- 100+ logged transactions analyzed
- 100+ drinks sold through logged cup-sale records
- Product-level sales pattern reviewed
- Positive event contribution profit estimated
- Visitor questions and post-event observations synthesized

Three priority initiatives

1

Introduce consumer category onboarding

Explain mezcal, tequila, agave, smoky flavor and drinking ritual before persuasion.

2

Refine opening brand messaging

Start with familiar category cues, then link to Oaxaca origin and agave craft.

3

Post-event owned-channel nurturing

Use one QR-led next step to capture follow, education, purchase or tasting interest.

Visitor interest stalled at three conversion bottlenecks

Visitor questions revealed the gap between attention, understanding and follow-up action.

Consumer questions at booth

"Is this perfume?"

"Where is Oaxaca?"

"Mezcal vs. tequila?"

"How do you drink it?"

Root-cause diagnosis

Category understanding

Consumers needed basic context on mezcal, tequila, agave and production before evaluating the product.

Value proposition

Make Oaxaca, agave craft and ritual directly relevant to taste, quality and trust.

Product differentiation

Three varieties needed clearer flavor, occasion and comparison guidance for first-time consumers.

Owned-channel follow-up

Use one QR-led next step to capture follow, education, purchase or tasting interest.

AI-assisted prompting helped identify the core conversion bottleneck

The workflow compared alternative issue framings, then selected the diagnosis that best matched booth evidence.

Step	Human judgment	AI-supported acceleration
Problem framing	Compared three framings: brand awareness, category education and conversion friction.	Asked what evidence would confirm or weaken each framing.
Evidence synthesis	Selected booth observations, visitor questions and outcome figures.	Grouped consumer insights around category confusion, origin context and next-step friction.
Recommendation design	Prioritized actions based on consumer friction points.	Generated and pressure-tested possible intervention options.
Output evaluation	Checked whether recommendations were specific, evidence-backed and actionable.	Used prompt chains to critique clarity, logic and decision-readiness.

End-to-end diagnostic workflow example

Generate candidate framings -> test each against booth signals -> select diagnosis: awareness-to-purchase funnel bottleneck.

Logically sound is not enough: AI outputs must be decision-ready.

This module turns AI-assisted drafting into a quality-control workflow for consulting-style recommendations.

Reframed consulting question

How can AI improve speed and clarity without weakening the evidence-to-recommendation chain?

Common AI-output risk

A fluent draft may improve readability while weakening causal logic, blurring timing, or overstating what the evidence supports.

Decision-ready output: the reader can see the facts, assumptions, logic, risks, and next action behind the recommendation.

1 Define decision standard

Set criteria for accuracy, evidence support, assumptions, stakeholder fit and actionability.

2 Stress-test recommendation

Ask what evidence would weaken the answer, where logic may break, and which assumptions matter most.

3 Audit reasoning drift

Flag changes in causality, timeline, certainty, terminology and stakeholder implication.

4 Codify quality-control rubric

Turn one review into a repeatable checklist for AI-assisted analytical work.

Reusable rubric
